

YOUR CUSTOMERS **WOULDN'T**
SETTLE FOR THIS IN THEIR HOMES.

SO WHY EXPECT THEM TO SETTLE FOR **WOBBLY**
WINDOWS?

Believe it or not, some window companies are having to send out **teams of fixers** on a **daily basis** to try to even out customers unaligned Georgian bar or spacer creep into the sight line, that completely spoils the appearance of their brand new energy rated windows.

The problem is of course that it's not easy to hand place a grid evenly when you're using foam edges. It might look OK on the table (eventually) but once the unit is assembled and glazed it is very often a different story. Someone once said (rather colourfully) that it's **like trying to nail a wriggling worm to a door**.

Good luck with that then.

And when customers see red if their Georgian bar doesn't line up - you'll see red in your accounts ledger.

The answer is to completely **eliminate human error** together with the inherent problem of trying to form a rigid grid out of **wobbly foam**.

Intercept *Blackline* Warm Edge spacer system from GED offers a totally automated alternative that positively locks Georgian bar securely in place for the life of the window.

Now we're talking.

Because Intercept *Blackline* is a metal alloy it can be precision cut or drilled automatically so that the polymer clips that hold the Georgian bar snap into position. And stay there.

What's more, because Intercept *Blackline* is U-shaped it doesn't intrude into the sightline either. Neat eh?

That's why Intercept *Blackline* has the industry's **lowest Callback rate**.

Oh yes, it's also Warm Edge.

Find out how Intercept *Blackline* automation can increase your production rate, eliminate Callbacks, and keep both your customers and your Financial Director happy.
